
Four Winds IT Website Redesign

Turning a Website Into a Clearer Sales &
Marketing Tool

The existing website wasn't effectively communicating Four Winds' value proposition or generating the quality of leads we wanted. We ran the numbers and knew it was time for a change...

Problem 1

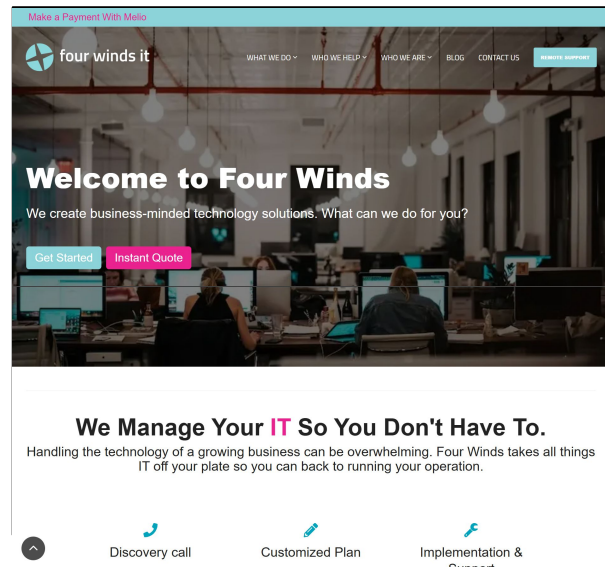

Conversions were low and low quality

What I found:

The website wasn't doing enough to help visitors quickly understand what we offered or determine whether we were relevant to them.

My approach:

Improve the site's readability and navigation so users could find relevant information faster , while making the content more discoverable through SEO.

Problem 2

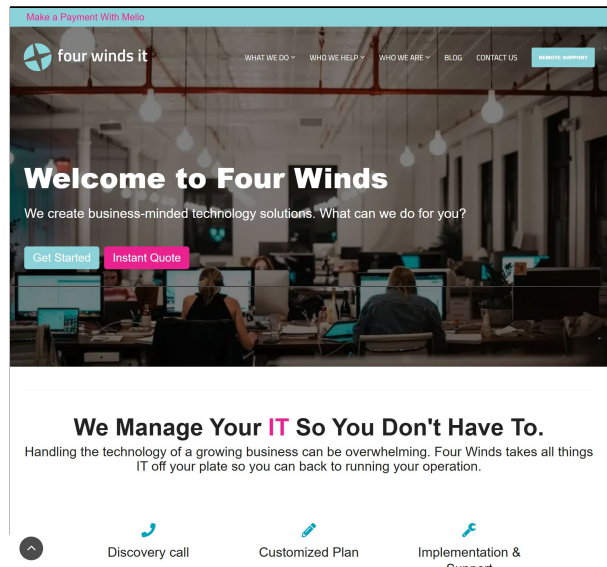

It was hard to tell who and what we were

What I found:

The site was carrying too much copy and inconsistent presentation, which made the core message difficult to identify.

My approach:

Remove unnecessary copy and standardize the visual structure to create a clearer, more consistent path through the site.

Rather than treating the redesign as a visual refresh, I approached it as a communication problem.

The site needed to do two things better:

help visitors understand who Four Winds was and
make it easier for the right visitors to find and act on
relevant information.

Clarified the messaging

Removed redundant copy and brought the most important information forward.

Aligning Business and Technology

Lifecycle management helps to marry the long-term goals of your business with your technology by facilitating:

✓	Smarter Spending	Most businesses are reactionary when it comes to technology spending, allocating resources last minute in order to deal with unexpected failures. By proactively scheduling upgrades and maintenance your business can optimize time and budget, focusing on developing technology that will actually improve your processes as opposed to constantly putting out fires.
✓	Hardened Security	Outdated hardware and software pose a major security risk to your organization. Manufacturers stop releasing patches and updates for end of life products and these updates are crucial to remediating newly exploited security vulnerabilities for end of life products.
✓	Enhanced Agility	Implementation of new applications can be a nightmare but by organizing your technology and establishing standards, software can be quickly and seamlessly deployed across your network with minimal interruption to the workday.
✓	Regulatory Compliance	Industries governed by regulatory compliance (healthcare, education, etc.) require organizations to maintain certain standards when it comes to data security. A proper lifecycle management plan will help your organization meet security standards and avoid any potential violations.
✓	Improved Morale	It's important to equip your staff with the right tools so they can be effective and productive. If your team feels as though they are being held back by the technology they're provided it can be extremely frustrating. By setting performance standards you'll know when it's time to recycle or upgrade equipment so your team maintains peak performance.

Outsourced IT designed by business owners powered by engineers.

How It works...

Smart IT management, built for you.

From day one, your systems are designed around what you truly need.

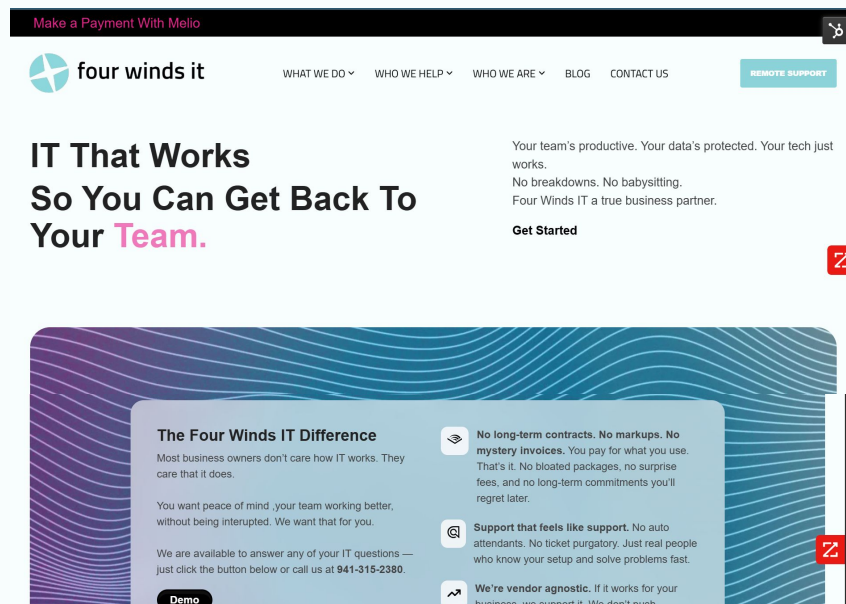

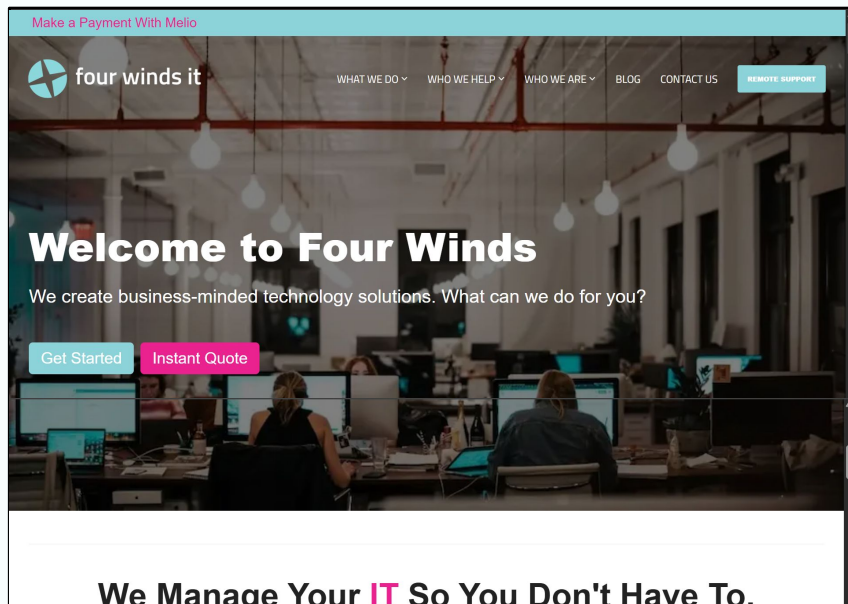

No bloated software. No unused tools. Just a streamlined setup that's secure, efficient, and built to grow with you.

When something breaks, we fix it. When it drags, we speed it up.

[Get Started](#)

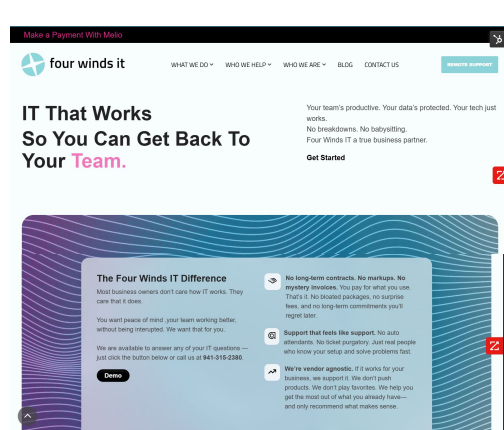

Simplified the information architecture

Reworked navigation and page structure around what visitors actually needed to understand.

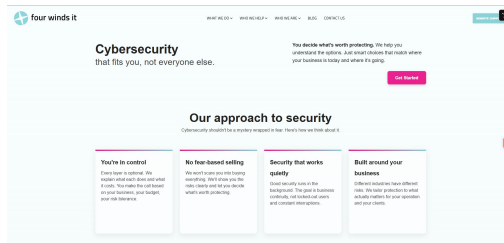

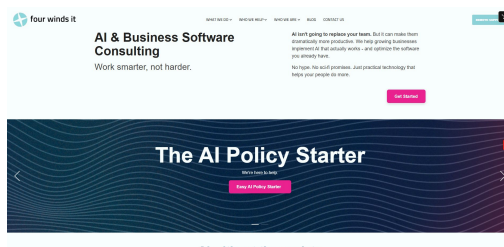

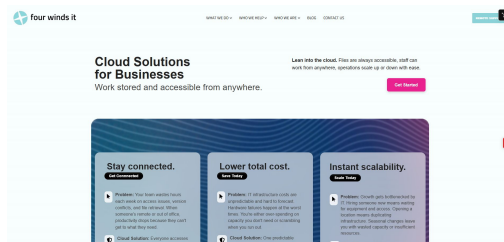

Standardized the visual system

Created consistency across pages so the site felt like one cohesive experience.

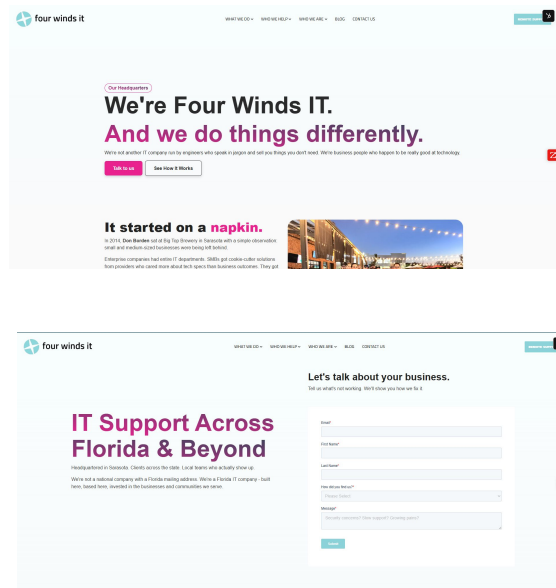

Homepage

Main services

Brand story

Landing pages

Improved search visibility

Reworked page content and structure with SEO/readability in mind.

Excel sheet audit of all of the web pages
and landing pages

This took a lot of
auditing and redirecting
many pages.

There was a lot to clean
up , simplify and remap
on HubSpot so that
pages flowed into each
other neatly.

Outcome

After 7 months of the website redesign there was..

- **20% increase** in direct traffic compared to last year
- **34** lead submissions with 27 converted into customers
- **More distributed conversions**
Location and industry pages began generating form submissions, reducing the site's reliance on the homepage as the primary conversion point.

Have questions about the UI/UX process? Just ask.

This case study is presented from a marketing perspective, so the full iteration and design process is intentionally condensed into this 12-slide overview.

Tip of the iceberg

Beyond layout and density of the text these were the assets that made the website disjointed.

Inconsistent use of
button type

Inconsistent use of
imagery
